

Lake Erie Harmful Algal Bloom Forecast

2026-09-01

Summary

The cyanobacteria bloom in western Lake Erie has an approximate area of 380 square miles, which is an increase in area since Aug 27. Clouds have obscured recent satellite imagery. As of 29 Aug. 2026, a cyanobacteria bloom is present in the western basin from Stony Point, MI to Port Clinton, OH with patches observed as far as Sandusky and the islands. Highest concentrations are around Maumee Bay. Weekly high resolution imagery of Maumee Bay can also be found at [the Demonstration Great Lakes \(20m\) HAB Monitoring Page](#). Toxins have been detected above the recreational limit in western Lake Erie. They can be highly concentrated in scums! If you see scum, keep your pets and yourself out of the water. In the satellite imagery or bloom forecast position products, any areas that are orange or red are likely to have scum, especially during calm winds, see Mixing Forecast product. -- Meredith, 1 Sep. 2026

The past few days of imagery can be seen at [the HAB monitoring site](#). The Lake Erie Forecast is operated by the National Centers for Coastal Ocean Science. Contact hab@noaa.gov for technical Questions. Model Last Updated: 2026-09-01 11 PM EST

Current Lake Erie Sentinel-3 satellite imagery from the Ocean and Land Color Imager (OLCI) on Aug 28, 2026, showing bloom location and extent in the western basin. Grey indicates clouds or missing data. The estimated threshold of cyanobacteria detection is 20,000 cells/mL. Inset shows an enhanced truecolor image of the entire lake. Data derived from Copernicus Sentinel-3.

Wind speed and direction from SouthBassIs, OH. Blooms mix through water column at wind speeds > 15 knots.

Where the bloom is present in western Lake Erie, the potential risk of scum.

Lake Erie Harmful Algal Bloom Forecast

2026-09-01

Forecast surface bloom position for Sep 02, modeled from the last satellite image with water currents estimated from the Lake Erie Operational Forecast System (LEOFS). Potential for bloom movement is forecast in 3-dimensions with a hydrodynamic model using satellite imagery and currents. The modeled output does not contain clouds. Black indicates the absence of chlorophyll and gray indicates area with no data. The arrows show forecasted currents. Water temperature and winds (in magenta) are the averages for the western basin from the model.

Forecast surface bloom position for Sep 05. Black indicates the absence of chlorophyll and gray indicates area with no data. The arrows show forecasted currents. Water temperature and winds (in magenta) are the averages for the western basin from the model.
